

THE DETAILING AESTHETIC

Correction before protection

Correction, protection, and obsessive finish work.

SERVICES

01 PAINT CORRECTION

1 — 3 days

Swirls, holograms and etching — machined out, not filled in.

A multi-stage machine polish that removes defects from the clear coat rather than hiding them under glaze. We measure the paint, test a section, and commit to a pad and compound combination only once the panel tells us what it needs.

Includes

- Paint depth gauge readings, panel by panel
- Test section and refinement mapping
- Compounding stage with rotary or dual-action
- Refinement polish to remove micro-marring
- Panel wipe and inspection under multiple light sources

02 CERAMIC COATING

2 — 4 days

A hard, hydrophobic layer that outlives every wax on the shelf.

A semi-permanent coating bonded to corrected paint. It resists chemical etching, sheds water aggressively, and makes maintenance washing faster and far safer for the finish. Applied in a controlled bay with a monitored cure.

Includes

- Full decontamination and panel preparation
- Correction stage as required before bonding
- Coating applied by hand, panel by panel
- Controlled infrared or ambient cure
- Aftercare pack and maintenance schedule

03 INTERIOR DETAIL

1 — 2 days

Every seam, vent and stitch line — accounted for.

A full strip-back of the cabin. Textiles are extracted, leather is cleaned and conditioned with pH-appropriate products, and every trim piece is dressed to a factory sheen rather than a wet-look shine.

Includes

- Full dry vacuum including under seats and rails
- Hot water extraction on carpets and fabric
- Leather clean and condition, stitch lines detailed
- Vents, switchgear and trim seams brush-detailed
- Glass finished streak-free, inside and out

04 PAINT PROTECTION FILM

3 — 6 days

Impact protection you have to be told is there.

Self-healing urethane film applied to the panels that take the abuse. Cut on a plotter to model-specific patterns, or bulk-cut and wrapped for edge-free coverage where the panel geometry allows it.

Includes

- Front-end, track pack or full-body coverage options
- Model-specific plotter patterns or bulk custom cuts
- Edge wrapping where panel geometry allows
- Self-healing topcoat, gloss or satin
- Coating over film available

05 WHEELS & CALIPERS

1 day

Off the car. Barrels included. No exceptions.

Wheels come off so the barrel, the inner face and the caliper get the same attention as the spoke faces. Cleaned, decontaminated and coated so brake dust rinses away instead of bonding.

Includes

- Wheels removed, arches cleaned
- Barrel and inner face decontamination
- Iron fallout and tar removal
- Caliper clean and detail
- High-temperature wheel coating

06 MAINTENANCE WASH

2 — 4 hours

The wash that protects the work already in the paint.

A safe-touch wash built for coated and corrected vehicles. Two buckets, pH-neutral chemistry and dedicated media — designed to keep a finish intact rather than slowly grind it down.

Includes

- Pre-rinse and dwell with pH-neutral foam
- Two-bucket contact wash with grit guards
- Wheels and arches with dedicated media
- Filtered or forced-air drying
- Coating topper to refresh hydrophobics

HOW A JOB RUNS

01 Intake & Inspection

45 — 90 min

The car is photographed, paint depth is measured, and defects are mapped under controlled lighting. Nothing is quoted before the panels have been read.

02 Decontamination

2 — 4 hrs

Chemical and mechanical decontamination lifts iron fallout, tar and bonded contaminants that a wash alone will never move.

03 Correction

8 — 30 hrs

Machine polishing in stages. Test sections determine the pad and compound; refinement removes the marring the cutting stage leaves behind.

04 Protection

4 — 12 hrs

Coating or film is applied to a surface that is genuinely ready for it, then cured in a controlled environment before the car moves.

05 Inspection & Handover

60 min

A second set of eyes, a second lighting setup, and a walkaround with you before the keys go back. Aftercare is explained, not handed over on a leaflet.
